

What did we do?

Community Health

Increased access to quality health care in rural areas, with particular attention to mothers and children under five years of age. Focused on increasing the number of appropriately trained and supported community health workers, addressing barriers to the availability of essential medicines, and supporting the use of mobile technology to improve the quality of care.

Sustainable Agriculture

Increased agricultural productivity and market access for small-holder farmers in an environmentally responsible manner, and helped strengthen resilience to climate change. Focused on introducing new farming practices, rehabilitating degraded land, and expanding access to markets and irrigation technologies.

Exploratory & Learning

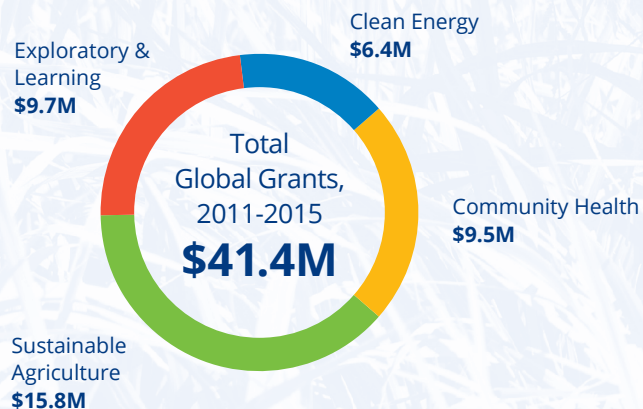

Explored new issues and areas for investment, including education, climate resilience, and womens' and girls' empowerment.

Clean Energy

Improved the health and economic welfare of families in rural areas by introducing new technology and reducing their environmental footprint. Invested in organizations with potential to increase access to affordable and clean energy by developing markets for clean cookstove technologies and solar lights, launching demonstration projects, and utilizing existing rural distribution platforms.

How were grant funds spent?

Where did we work?

East Africa Primarily Ethiopia, Kenya, Malawi, Uganda, and Tanzania

Haiti Primarily Archaie region, Artibonite Valley, Central Plateau, and northern and southeastern regions

India Primarily states of Rajasthan, Uttarakhand, Tamil Nadu, Odisha, Jharkhand, West Bengal, and Assam

Who did we work with?

All of our activities were planned and implemented in close collaboration with community members, local organizations, and governments with a strong focus on capacity building. Our partners support smallholder farmers to improve their crop yields and manage their natural resources, train community health workers to improve the health of mothers and young children, and introduce and scale business models that create sustainable markets for important household goods, such as solar lights and irrigation pumps.
